Group Name:	
Group Members:	

1 Regression, Gradient Descent and the Perceptron

Derive a gradient descent training algorithm that minimizes the sum of squared errors for a variant of a perceptron where the output o depends on its units as follows:

$$o = w_0 + w_1 x_1 + w_1 x_1^3 + w_2 x_2 + w_2 x_2^3 + \ldots + w_d x_d + w_d x_d^3$$

Give your answer in the form $w_i \leftarrow w_i + \ldots$ for $1 \leq i \leq d$

2 Support Vector Machines

You train an SVM using N training points. You observe that the trained model has M support vectors. A new set of K points arrives. You retrain your SVM using N + K points. Can you tell how many support vectors your new model will have?
