Recap

Definitions: Generalization and Model Selection

Bias-Variance Trade-off

Expected Label

Machine Learning Algorithms, Learning Process & Hypothesis

Expected Generalization Error Given  $h_{\mathcal{D}}$ 

**Expected Predictor** 

Expected Generalization Error of  ${\mathcal A}$ 

Decomposition of the Generalization Error

Analysis

Wrap-up

# Recap

#### So far in this course

- We have covered several machine learning methods:
  - Linear regression
  - Linear discriminant analysis
  - Logistic regression
  - The perceptron

#### So far in this course

- We have covered several machine learning methods
- We have stated that it is important that our trained models generalize
- We started to discuss some problems, such as the variance
- But, we have not really looked into it nor asked too many questions about our models:
  - Will they perform well on testing data?
  - Is the training data available enough?
  - Among many models, which one should be chosen?

#### So far in this course

- We have covered several machine learning methods
- We have stated that it is important that our trained models generalize
- We started to discuss some problems, such as the variance
- But, we have not really looked into it nor asked too many questions about our models:
  - Will they perform well on testing data?
  - Is the training data available enough?
  - Among many models, which one should be chosen?

#### This lecture:

We will answer these questions from a theoretical and practical perspective

#### **Definitions**

• Generalization: Ability of a model to perform well on unseen data

$$\epsilon = \mathbb{E}_{(\mathbf{x}, \mathbf{y}) \sim \mathcal{P}}[I(\mathbf{y}, h(\mathbf{x}))]$$

Generalization loss (from Lecture 1)

#### **Definitions**

• Generalization: Ability of a model to perform well on unseen data

$$\epsilon = \mathbb{E}_{(\mathbf{x}, \mathbf{y}) \sim \mathcal{P}}[I(\mathbf{y}, h(\mathbf{x}))]$$

**Generalization loss** (from Lecture 1)

- Model Selection: Task of selecting a model from a set of candidate models given the data
  - Intuitively, we arrived to the conclusion that this is a necessary step but, we have not
    addressed it properly.
  - Examples: order of the polynomial features, features to use for a specific problem (lab 1), neural networks, the  $\lambda$  term in regularization

**Bias-Variance Trade-off** 

#### **Generalization Error**

- We have focused on the minimization of the training error (loss)
- So far, we expect that this is good enough for our trained model to generalize.

#### **Generalization Error**

- We have focused on the minimization of the training error (loss)
- So far, we expect that this is good enough for our trained model to generalize.

- Generalize: Perform well on unseen data
- Lets have a detailed look into the generalization error:

$$\epsilon = \mathbb{E}_{(\mathbf{x}, \mathbf{y}) \sim \mathcal{P}}[I(\mathbf{y}, h(\mathbf{x}))] \tag{1}$$

#### **Definitions: Expected Label**

- The training data comes in input pairs  $(\mathbf{x}, \mathbf{y})$ , with  $\mathbf{x} \in \mathbb{R}^D$  and  $\mathbf{y} \in \mathcal{C}$ .
- ullet We will focus on the case where  $\mathcal{C}=\mathbb{R}^{\mathcal{O}},\ \mathcal{O}=1$
- The **training set** points  $\{(\mathbf{x}_i, \mathbf{y}_i)\}_{i=1}^N$  i.i.d. drawn from an unknown probability distribution  $\mathcal{P}(\mathbf{X}, \mathbf{Y})$ .

#### **Definitions: Expected Label**

- The training data comes in input pairs  $(\mathbf{x}, \mathbf{y})$ , with  $\mathbf{x} \in \mathbb{R}^D$  and  $\mathbf{y} \in \mathcal{C}$ .
- We will focus on the case where  $\mathcal{C}=\mathbb{R}^O,\ O=1$
- The **training set** points  $\{(\mathbf{x}_i, \mathbf{y}_i)\}_{i=1}^N$  i.i.d. drawn from an unknown probability distribution  $\mathcal{P}(\mathbf{X}, \mathbf{Y})$ .
- **Important:** For a given **x** there is a distribution of **y**

$$\mathcal{P}(X, Y) = \mathcal{P}(Y|X)\mathcal{P}(X)$$

#### **Definitions: Expected Label**

- The training data comes in input pairs  $(\mathbf{x}, \mathbf{y})$ , with  $\mathbf{x} \in \mathbb{R}^D$  and  $\mathbf{y} \in \mathcal{C}$ .
- We will focus on the case where  $\mathcal{C} = \mathbb{R}^O, \ O = 1$
- The **training set** points  $\{(\mathbf{x}_i, \mathbf{y}_i)\}_{i=1}^N$  i.i.d. drawn from an unknown probability distribution  $\mathcal{P}(\mathbf{X}, \mathbf{Y})$ .
- Important: For a given x there is a distribution of y

$$\mathcal{P}(X, Y) = \mathcal{P}(Y|X)\mathcal{P}(X)$$

#### **Definition 1: Expected Label**

$$\bar{y}(\mathbf{x}) = \mathbb{E}_{\mathbf{y}|\mathbf{x}}[\mathbf{y}] = \int \mathbf{y} \mathcal{P}(\mathbf{y}|\mathbf{x}) d\mathbf{y}$$
 (2)

## Machine Learning Algorithms, Learning Process & Hypothesis

- ullet Let us now denote a machine learning algorithm as  ${\cal A}$
- Learning Process: We use an algorithm  $\mathcal A$  in conjunction with the training set  $\mathcal D$  to learn a hypothesis  $h\in\mathcal H$

## Machine Learning Algorithms, Learning Process & Hypothesis

- ullet Let us now denote a machine learning algorithm as  ${\cal A}$
- Learning Process: We use an algorithm  $\mathcal A$  in conjunction with the training set  $\mathcal D$  to learn a hypothesis  $h\in\mathcal H$
- Formally,

$$h_{\mathcal{D}} = \mathcal{A}(\mathcal{D}) \tag{3}$$

• Since we are working with regression, we can use the quadratic loss in Eq. 1

$$\epsilon = \mathbb{E}_{(\mathbf{x}, \mathbf{y}) \sim \mathcal{P}}[(h(\mathbf{x}) - \mathbf{y})^2]$$

• Since we are working with regression, we can use the quadratic loss in Eq. 1

$$\epsilon = \mathbb{E}_{(\mathbf{x}, \mathbf{y}) \sim \mathcal{P}}[(h(\mathbf{x}) - \mathbf{y})^2]$$

ullet We also redefined h as  $h_{\mathcal{D}}$  to denote its dependency to the dataset

• Since we are working with regression, we can use the quadratic loss in Eq. 1

$$\epsilon = \mathbb{E}_{(\mathbf{x}, \mathbf{y}) \sim \mathcal{P}}[(h(\mathbf{x}) - \mathbf{y})^2]$$

• We also redefined h as  $h_D$  to denote its dependency to the dataset

Definition 2: Expected Generalization Error (given  $h_{\mathcal{D}}$ )

$$\epsilon = \mathbb{E}_{(\mathbf{x}, \mathbf{y}) \sim \mathcal{P}}[(h_{\mathcal{D}}(\mathbf{x}) - \mathbf{y})^2]$$
(4)

• Since we are working with regression, we can use the quadratic loss in Eq. 1

$$\epsilon = \mathbb{E}_{(\mathbf{x}, \mathbf{y}) \sim \mathcal{P}}[(h(\mathbf{x}) - \mathbf{y})^2]$$

• We also redefined h as  $h_D$  to denote its dependency to the dataset

#### Definition 2: Expected Generalization Error (given $h_D$ )

$$\epsilon = \mathbb{E}_{(\mathbf{x}, \mathbf{y}) \sim \mathcal{P}}[(h_{\mathcal{D}}(\mathbf{x}) - \mathbf{y})^{2}]$$

$$= \int_{\mathbf{x}} \int_{\mathbf{y}} (h_{\mathcal{D}}(\mathbf{x}) - \mathbf{y})^{2} \mathcal{P}(\mathbf{x}, \mathbf{y}) \partial \mathbf{y} \partial \mathbf{x}$$
(4)

## **Definitions: Expected Predictor**

- ullet The term in Eq. 4 is valid for a given  ${\cal D}$
- $\mathcal{D}$  is drawn from  $\mathcal{P}^N$ . It is a random variable.

## **Definitions: Expected Predictor**

- ullet The term in Eq. 4 is valid for a given  ${\cal D}$
- $\mathcal{D}$  is drawn from  $\mathcal{P}^N$ . It is a random variable.
- Since  $h_{\mathcal{D}}$  is a function of  $\mathcal{D}$ , it is a random variable too.
- We can compute its expectation

## **Definitions: Expected Predictor**

- The term in Eq. 4 is valid for a given  $\mathcal{D}$
- $\mathcal{D}$  is drawn from  $\mathcal{P}^N$ . It is a random variable.
- Since  $h_{\mathcal{D}}$  is a function of  $\mathcal{D}$ , it is a random variable too.
- We can compute its expectation

#### Definition 3: Expected Predictor (given A)

$$\bar{h} = \mathbb{E}_{\mathcal{D} \sim \mathcal{P}^N}[h_{\mathcal{D}}] = \int_{\mathcal{D}} h_{\mathcal{D}} \mathcal{P}(\mathcal{D})$$
 (5)

- ullet We are interested in knowing the generalization error of a type of method in general. Not just  $h_{\mathcal{D}}$
- ullet We need to integrate over all  $h_{\mathcal{D}}$

- We are interested in knowing the generalization error of a type of method in general. Not just  $h_{\mathcal{D}}$
- We need to integrate over all  $h_{\mathcal{D}}$

#### **Definition 4: Expected Generalization Error of** A

$$\epsilon = \mathbb{E}_{(\mathbf{x}, \mathbf{y}) \sim \mathcal{P}, \mathcal{D} \sim \mathcal{P}^N} [(h_{\mathcal{D}}(\mathbf{x}) - \mathbf{y})^2]$$
 (6)

- We are interested in knowing the generalization error of a type of method in general. Not just  $h_{\mathcal{D}}$
- We need to integrate over all  $h_{\mathcal{D}}$

#### **Definition 4: Expected Generalization Error of** $\mathcal{A}$

$$\epsilon = \mathbb{E}_{(\mathbf{x}, y) \sim \mathcal{P}, \mathcal{D} \sim \mathcal{P}^N} [(h_{\mathcal{D}}(\mathbf{x}) - y)^2]$$

$$= \int_{\mathcal{D}} \int_{\mathbf{x}} \int_{\mathbf{y}} (h_{\mathcal{D}}(\mathbf{x}) - y)^2 \mathcal{P}(\mathbf{x}, y) \mathcal{P}(\mathcal{D}) \partial y \partial \mathbf{x} \partial \mathcal{D}$$
(6)

- We are interested in knowing the generalization error of a type of method in general. Not just h<sub>D</sub>
- We need to integrate over all  $h_{\mathcal{D}}$

#### **Definition 4: Expected Generalization Error of** $\mathcal{A}$

$$\epsilon = \mathbb{E}_{(\mathbf{x}, y) \sim \mathcal{P}, \mathcal{D} \sim \mathcal{P}^N} [(h_{\mathcal{D}}(\mathbf{x}) - y)^2]$$

$$= \int_{\mathcal{D}} \int_{\mathbf{x}} \int_{\mathbf{y}} (h_{\mathcal{D}}(\mathbf{x}) - y)^2 \mathcal{P}(\mathbf{x}, y) \mathcal{P}(\mathcal{D}) \partial y \partial \mathbf{x} \partial \mathcal{D}$$
(6)

**Important:** In Eq. 6,  $(\mathbf{x}, \mathbf{y}) \sim \mathcal{P}$  denotes points at testing and  $\mathbf{D} \sim \mathcal{P}^{N}$  is training data

- We are interested in knowing the generalization error of a type of method in general. Not just  $h_{\mathcal{D}}$
- We need to integrate over all  $h_D$

#### Definition 4: Expected Generalization Error of ${\cal A}$

$$\epsilon = \mathbb{E}_{(\mathbf{x}, y) \sim \mathcal{P}, \mathcal{D} \sim \mathcal{P}^N} [(h_{\mathcal{D}}(\mathbf{x}) - y)^2]$$

$$= \int_{\mathcal{D}} \int_{\mathbf{x}} \int_{\mathbf{y}} (h_{\mathcal{D}}(\mathbf{x}) - y)^2 \mathcal{P}(\mathbf{x}, y) \mathcal{P}(\mathcal{D}) \partial y \partial \mathbf{x} \partial \mathcal{D}$$
(6)

**Important:** In Eq. 6,  $(x, y) \sim \mathcal{P}$  denotes points at testing and  $\mathcal{D} \sim \mathcal{P}^N$  is training data **In words:** We measure how well an algorithm  $\mathcal{A}$  generalizes with respect to a data distribution  $\mathcal{P}(X, Y)$ 

$$\mathbb{E}_{(\mathbf{x},y)\sim\mathcal{P},\mathbb{D}\sim\mathcal{P}^N}[(h_{\mathcal{D}}(\mathbf{x})-y)^2]\to\mathbb{E}_{\mathbf{x},y,\mathcal{D}}[(h_{\mathcal{D}}(\mathbf{x})-y)^2]$$

Let's have a deeper look into it:

$$\mathbb{E}_{(\mathbf{x},y)\sim\mathcal{P},\mathcal{D}\sim\mathcal{P}^N}[(h_{\mathcal{D}}(\mathbf{x})-y)^2]\to\mathbb{E}_{\mathbf{x},y,\mathcal{D}}[(h_{\mathcal{D}}(\mathbf{x})-y)^2]$$

Let's have a deeper look into it:

$$\mathbb{E}_{\mathbf{x},y,\mathcal{D}}[(h_{\mathcal{D}}(\mathbf{x}) - y)^{2}] = \mathbb{E}_{\mathbf{x},y,\mathcal{D}}[(h_{\mathcal{D}}(\mathbf{x}) - \bar{h}(\mathbf{x}) + \bar{h}(\mathbf{x}) - y)^{2}]$$

$$= \mathbb{E}_{\mathbf{x},y,\mathcal{D}}[((h_{\mathcal{D}}(\mathbf{x}) - \bar{h}(\mathbf{x})) + (\bar{h}(\mathbf{x}) - y))^{2}]$$

$$= \mathbb{E}_{\mathbf{x},\mathcal{D}}[(h_{\mathcal{D}}(\mathbf{x}) - \bar{h}(\mathbf{x}))^{2}] + \mathbb{E}_{\mathbf{x},y}[(\bar{h}(\mathbf{x}) - y)^{2}]$$

$$+ 2\mathbb{E}_{\mathbf{x},y,\mathcal{D}}[(h_{\mathcal{D}}(\mathbf{x}) - \bar{h}(\mathbf{x}))(\bar{h}(\mathbf{x}) - y)]$$

The last term is equal to zero:

$$\begin{split} \mathbb{E}_{\mathbf{x},y,\mathcal{D}}[(h_{\mathcal{D}}(\mathbf{x}) - \bar{h}(\mathbf{x}))(\bar{h}(\mathbf{x}) - y)^{2}] &= \mathbb{E}_{\mathbf{x},y}[\mathbb{E}_{\mathcal{D}}[(h_{\mathcal{D}}(\mathbf{x}) - \bar{h}(\mathbf{x}))](\bar{h}(\mathbf{x}) - y)] \\ &= \mathbb{E}_{\mathbf{x},y}[(\mathbb{E}_{\mathcal{D}}[h_{\mathcal{D}}(\mathbf{x})]) - \mathbb{E}_{\mathcal{D}}[\bar{h}(\mathbf{x})](\bar{h}(\mathbf{x}) - y)] \\ &= \mathbb{E}_{\mathbf{x},y}[(\bar{h}(\mathbf{x}) - \bar{h}(\mathbf{x}))(\bar{h}(\mathbf{x}) - y)] = 0 \end{split}$$

$$\mathbb{E}_{\mathbf{x},\mathbf{y},\mathcal{D}}[(h_{\mathcal{D}}(\mathbf{x})-\mathbf{y})^{2}] = \underbrace{\mathbb{E}_{\mathbf{x},\mathcal{D}}[(h_{\mathcal{D}}(\mathbf{x})-\bar{h}(\mathbf{x}))^{2}]}_{\text{variance}} + \mathbb{E}_{\mathbf{x},\mathbf{y}}[(\bar{h}(\mathbf{x})-\mathbf{y})^{2}]$$
(7)

Let's do a similar manipulation to the second term in Eq. 7:

$$\mathbb{E}_{\mathbf{x},\mathbf{y},\mathcal{D}}[(h_{\mathcal{D}}(\mathbf{x})-\mathbf{y})^{2}] = \underbrace{\mathbb{E}_{\mathbf{x},\mathcal{D}}[(h_{\mathcal{D}}(\mathbf{x})-\bar{h}(\mathbf{x}))^{2}]}_{\text{variance}} + \mathbb{E}_{\mathbf{x},\mathbf{y}}[(\bar{h}(\mathbf{x})-\mathbf{y})^{2}]$$
(7)

Let's do a similar manipulation to the second term in Eq. 7:

$$\begin{split} \mathbb{E}_{\mathbf{x},y}[(\bar{h}(\mathbf{x}) - y)^2] &= \mathbb{E}_{\mathbf{x},y}[(\bar{h}(\mathbf{x}) - \bar{y}(\mathbf{x}) + \bar{y}(\mathbf{x}) - y)^2] \\ &= \mathbb{E}_{\mathbf{x},y}[((\bar{h}(\mathbf{x}) - \bar{y}(\mathbf{x})) + (\bar{y}(\mathbf{x}) - y))^2] \\ &= \mathbb{E}_{\mathbf{x}}[(\bar{h}(\mathbf{x}) - \bar{y})^2] + \mathbb{E}_{\mathbf{x},y}[(\bar{y}(\mathbf{x}) - y)^2] + 2\mathbb{E}_{\mathbf{x},y}[(\bar{y}(\mathbf{x}) - y)(\bar{h}(\mathbf{x}) - \bar{y})] = 0 \end{split}$$

The last term is equal to zero:

$$\begin{split} \mathbb{E}_{\mathbf{x},y}[(\bar{y}(\mathbf{x}) - y)(\bar{h}(\mathbf{x}) - \bar{y})] &= \mathbb{E}_{\mathbf{x}}[\mathbb{E}_{y|\mathbf{x}}[(\bar{y}(\mathbf{x}) - y)](\bar{h}(\mathbf{x}) - \bar{y})] \\ &= \mathbb{E}_{\mathbf{x}}[(\mathbb{E}_{y|\mathbf{x}}[\bar{y}(\mathbf{x})] - \mathbb{E}_{y|\mathbf{x}}[y])(\bar{h}(\mathbf{x}) - \bar{y})] \\ &= \mathbb{E}_{\mathbf{x}}[(\bar{y}(\mathbf{x}) - \bar{y}(\mathbf{x}))(\bar{h}(\mathbf{x}) - \bar{y})] = 0 \end{split}$$

$$\mathbb{E}_{\mathbf{x},\mathbf{y},\mathcal{D}}[(h_{\mathcal{D}}(\mathbf{x})-\mathbf{y})^2] = \underbrace{\mathbb{E}_{\mathbf{x},\mathcal{D}}[(h_{\mathcal{D}}(\mathbf{x})-\bar{h}(\mathbf{x}))^2]}_{\text{Variance}} + \underbrace{\mathbb{E}_{\mathbf{x},\mathbf{y}}[(\bar{y}(\mathbf{x})-\mathbf{y})^2]}_{\text{Noise}} + \underbrace{\mathbb{E}_{\mathbf{x}}[(\bar{h}(\mathbf{x})-\bar{y}(\mathbf{x}))^2]}_{\text{Bias}^2}$$

$$\mathbb{E}_{\mathbf{x},y,\mathcal{D}}[(h_{\mathcal{D}}(\mathbf{x})-y)^2] = \underbrace{\mathbb{E}_{\mathbf{x},\mathcal{D}}[(h_{\mathcal{D}}(\mathbf{x})-\bar{h}(\mathbf{x}))^2]}_{\text{Variance}} + \underbrace{\mathbb{E}_{\mathbf{x},y}[(\bar{y}(\mathbf{x})-y)^2]}_{\text{Noise}} + \underbrace{\mathbb{E}_{\mathbf{x}}[(\bar{h}(\mathbf{x})-\bar{y}(\mathbf{x}))^2]}_{\text{Bias}^2}$$

Variance: Error caused from sensitivity to fluctuations in the training set. How much does the model change if it is trained in a different dataset. High variance can cause an algorithm to model noise from the training data rather than the intended targets (overfitting)

$$\mathbb{E}_{\mathbf{x},y,\mathcal{D}}[(h_{\mathcal{D}}(\mathbf{x})-y)^2] = \underbrace{\mathbb{E}_{\mathbf{x},\mathcal{D}}[(h_{\mathcal{D}}(\mathbf{x})-\bar{h}(\mathbf{x}))^2]}_{\text{Variance}} + \underbrace{\mathbb{E}_{\mathbf{x},y}[(\bar{y}(\mathbf{x})-y)^2]}_{\text{Noise}} + \underbrace{\mathbb{E}_{\mathbf{x}}[(\bar{h}(\mathbf{x})-\bar{y}(\mathbf{x}))^2]}_{\text{Bias}^2}$$

Variance: Error caused from sensitivity to fluctuations in the training set. How much does the model change if it is trained in a different dataset. High variance can cause an algorithm to model noise from the training data rather than the intended targets (overfitting)

Bias: The inherent error that you obtain from the model even with infinite training data. This is due to the classifier being biased to a particular solution (e.g. linear classifier)

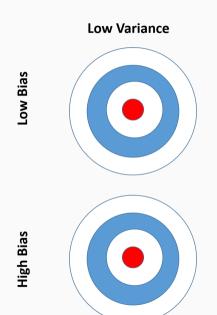

$$\mathbb{E}_{\mathbf{x},y,\mathcal{D}}[(h_{\mathcal{D}}(\mathbf{x})-y)^2] = \underbrace{\mathbb{E}_{\mathbf{x},\mathcal{D}}[(h_{\mathcal{D}}(\mathbf{x})-\bar{h}(\mathbf{x}))^2]}_{\text{Variance}} + \underbrace{\mathbb{E}_{\mathbf{x},y}[(\bar{y}(\mathbf{x})-y)^2]}_{\text{Noise}} + \underbrace{\mathbb{E}_{\mathbf{x}}[(\bar{h}(\mathbf{x})-\bar{y}(\mathbf{x}))^2]}_{\text{Bias}^2}$$

Variance: Error caused from sensitivity to fluctuations in the training set. How much does the model change if it is trained in a different dataset. High variance can cause an algorithm to model noise from the training data rather than the intended targets (overfitting)

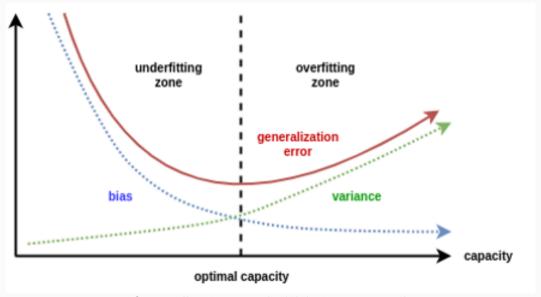

Bias: The inherent error that you obtain from the model even with infinite training data. This is due to the classifier being biased to a particular solution (e.g. linear classifier)

Noise: The error associated to the data. It measures ambiguity due to your data distribution and feature representation. You can never beat this.

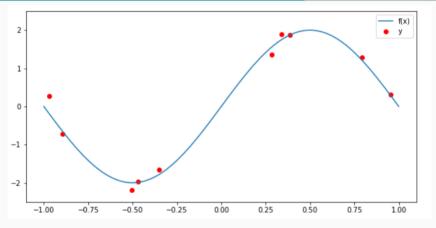

# Analysis

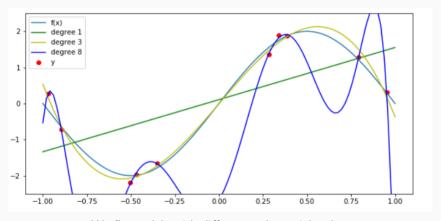

#### A Simulated Example

$$f(\mathbf{x}) = \sin(\pi \mathbf{x})$$
  
 $\mathbf{y} = f(\mathbf{x}) + \mathcal{N}(0, \sigma^2)$ 

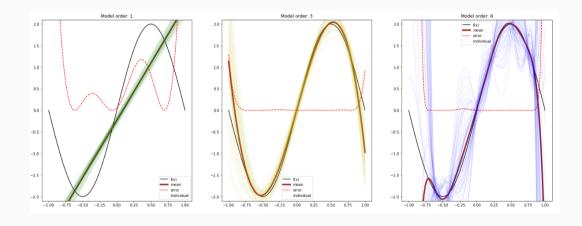

Notebook: See 04\_bias\_variance.ipynb

#### A Simulated Example: Model Fitting

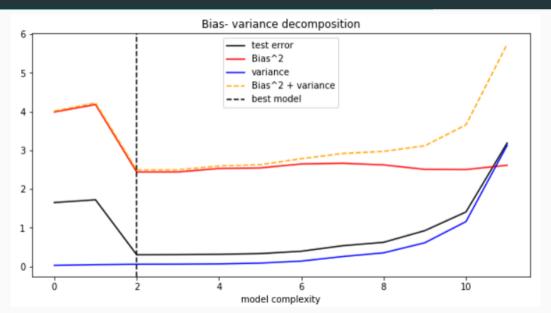

We fit models with different polynomial orders

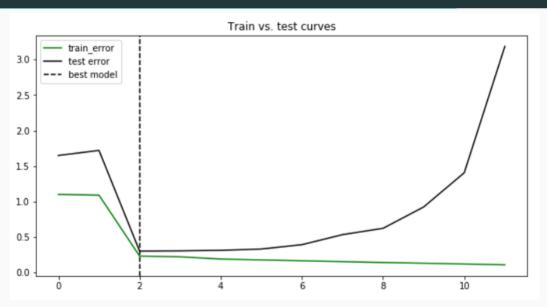

## Simulation with 50 sampled datasets

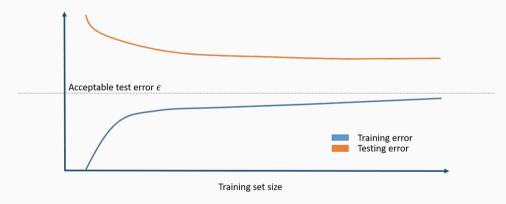

## Bias-variance Decomposition (100 datasets)

# Training vs. Testing Curve (100 datasets)

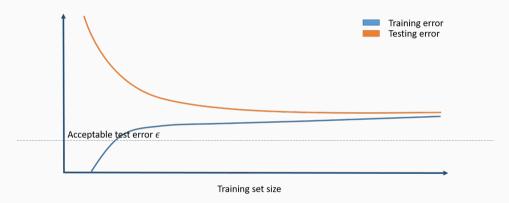

#### **Detection of High Bias / Variance: Scenario 1**

**High Variance Symptoms:** Test error  $> \epsilon$ , training error  $\ll \epsilon$ , training error  $\ll$  test error **Potential solutions:** More training data, reduce model complexity, bagging

#### Detection of High Bias / Variance: Scenario 2

 $\mbox{\bf High Bias Symptoms:} \ \mbox{Training error} > \epsilon \\ \mbox{\bf Potential solutions:} \ \mbox{More complex model,add features, boosting} \\$ 

#### **Training vs. Test Error: Summary**

	Small training error	Large training error
Small testing error	Generalizes and performs	Plausible but weird (*)
Large testing error	Fails to generalize	Generalizes but performs poorly

Wrap-up

#### Wrap-up

- We studied in detail the generalization error
- We introduced the concept of bias and formalized that one of variance
- We had some insights on how to detect these problems in practice

#### Key Concepts

- Bias
- Variance
- Overfitting
- Noise
- Generalization Error
